New gastrointestinal polynucleotides, CS198, and their detection - used for developing products for the diagnosis and treatment of gastrointestinal disorders, e.g. cancers, gastric ulcer or gastritis.

Claim 26; Page 102; 127pp; English.

CCCCCCCX PXX PPTX DXX PPTX DXX PR AAW79677-W79680 are synthetic CS198 derived peptide fragments which are used in a method to detect the presence of a target human CS198 polynuclectide in a test sample. The CS198 gene is useful as a marker for gastrointestinal (GI) tract disorders. The methods and products can be used in detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining the predisposition to diseases and conditions of the GI tract, such as GI tract cancer, Barret's oesophagus, gastric ulcer, gastritis, leiomyoma, polyps, oesophagus, ulcerative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
     The invention relates to a method of detecting the presence of a target CS 198 polynucleotide comprising contacting the test sample with at least CS 198 specific polynucleotide. The method is useful for detecting diseases of the gastrointestinal (GI) tract organs, particularly cancer. The CS 198 polynucleotides, polypeptides and antibodies are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing, tract such as cancer, gastric ulcer, gastrities and conditions of the GI tract such as cancer, gastric ulcer, gastrities, Crohn's disease, ulcerative colitis, pancreatitis and Barret's oesophagus. The CS 198 polypeptides are useful as standards or reagents in diagnostic
                                                                                                                                                                    Detecting the presence of target CS 198 polynucleotide, useful for detecting or diagnosing diseases of the gastrointestinal tract, comprises contacting test sample with at least one CS 198-specific polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CS 198; gastrointestinal tract disease; GI tract; cancer; gastric ulcer; gastritis; Crohn's disease; ulcerative colitis; pancreatitis; Barret's oesophagus; gene therapy; drug screening; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 31

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunoassays, as components or as target sites for various therapies. Antibodies directed against at least one epitope contained within these polypeptides are useful as delivery agents for therapeutic agents, in diagnostic tests and for screening for conditions or diseases associated with CS 198, particularly cancer. Monoclonal antibodies may also be used for the generation of chimeric antibodies for therapeutic use. The CS 198 polymucleotide is also useful in gene therapy and drug screening. The method capable of detecting early stage GI tract disease such as cancer. The present sequence is a peptide derived from human CS 198 polypeptide.

Detecting the presence of a target CS198 polynucleotide in a test comprises contacting the sample with a CS198 specific polynucleoti

de in a test sample polynucleotide and

the test

comprises contacting the sample with a CS198 specific polydetecting the presence of the target CS198 polynucleotide

sample

Claim 17;

Page 51;

67pp; English

The invention describes a method of detecting the presence of a target CS198 polynucleotide in a test sample. The method comprises contacting the test sample with at least one CS198 specific polynucleotide or its complement, and detecting the presence of the target CS198 polynucleotide in the test sample, where the CS198-specific polynucleotide has at least solvide in the test sample, where the CS198-specific polynucleotide has at least solvide in the test sample, where the CS198-specific polynucleotide has at least solvide in the test sample, where the CS198-specific polynucleotide has at least solvide in the specification, or their fragments of 34-2894 bp (S1-27) given in the specification, or their fragments or complements. The composition and methods are useful in

conditions of the gastrointestinal tract, e.g. cancer and in gene therapy. This is the amino acid sequence of a synthetic peptide based the predicted human CS198 protein sequence derived from the CS198 consensus sequence shown in seq id 27.

English.

This sequence represents the C-terminal of the human CS198 protein which is used in a method to detect the presence of a target CS198 polynucleotide in a test sample. The CS198 gene is useful as a marker for gastrointestinal (GI) tract disorders. The methods and products can be used in detecting, diagnosing, staying, monitoring, prognosticating, preventing or treating, or determining the predisposition to diseases and conditions of the GI tract, such as GI tract cancer, Barret's oesophagus, gastric ulcer, gastritis, leiomyoma, polyps, Crohn's disease, ulcerative

New gastrointestinal polynucleotides, CS198, and their detection - used for developing products for the diagnosis and treatment of gastrointestinal disorders, e.g. cancers, gastric ulcer or gastritis.

     The invention relates to a method of detecting the presence of a target CS 198 polynucleotide comprising contacting the test sample with at least one CS 198 specific polynucleotide. The method is useful for detecting diseases of the gastrointestinal (GI) tract organs, particularly cancer. The CS 198 polynucleotides, polypeptides and antibodies are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating or determining predisposition to diseases and conditions of the CI tract such as cancer, gastric ulcer, gastritis, Crohn's disease, ulcerative colitis, pancreatitis and Barret's oesophagus. The CS 198 polypeptides are useful as standards or reagents in diagnostic immunoassays, as components or as target sites for various therapies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CS 198; gastrointestinal tract disease; GI tract; cancer; gastritis; Crohn's disease; ulcerative colitis; pancreatitis; Barret's oesophagus; gene therapy; drug screening; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibodies directed against at least one epitope contained within these polypeptides are useful as delivery agents for therapeutic agents, in diagnostic tests and for screening for conditions or diseases associated with CS 198, particularly cancer. Monoclonal antibodies may also be used for the generation of chimeric antibodies for therapeutic use. The CS 198 polymucleotide is also useful in gene therapy and drug screening. The method of the invention provides an alternative, non-surgical diagnostic method capable of detecting early stage GI tract disease such as cancer. The present sequence is C-terminal portion of human CS 198 polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a method of detecting the presence of a target CS198 polynucleotide in a test sample. The method comprises contacting the test sample with at least one CS198 specific polynucleotide or its complement, and detecting the presence of the target CS198 polynucleotide in the test sample, where the CS198 specific polynucleotide has at least to the test sample, where the CS198 specific polynucleotide has a polynucleotide having any of the 27 fully defined sequences of 34-2894 bp (S1-27) given in the specification, or their fragments or complements. The composition and methods are useful in diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining the predisposition of an individual to, diseases and conditions of the gastrointestinal tract, e.g. cancer and in gene therapy. This is the amino acid sequence of a synthetic peptide based on the predicted human CS198 protein sequence derived from the CS198 consensus sequence shown in seq id 27.

                                                                                    This sequence represents the human CS198 protein which is used in a method to detect the presence of a target CS198 polymucleotide in a tensample. The CS198 gene is useful as a marker for gastrointestinal (GI) tract disorders. The methods and products can be used in detecting, diagnosing, staging, monitoring, prognosticating, preventing or treation determining the predisposition to diseases and conditions of the GI tract, such as GI tract cancer, Barret's oesophagus, gastric ulcer, gastritis, lelomyoma, polyps, Crohn's disease, ulcerative colitis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAKS2581) 2111 (AAKS2582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                        New gastrointestinal polynucleotides, CS198, and their detection - for developing products for the diagnosis and treatment of gastrointestinal disorders, e.g. cancers, gastric ulcer or gastriti

The invention relates to a method of detecting the presence of a target CS 198 polynucleotide comprising contacting the test sample with at least one CS 198-specific polynucleotide. The method is useful for detecting diseases of the gastrointestinal (GI) tract organs, particularly cancer. The CS 198 polynucleotides, polypeptides and antibodies are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating or determining predisposition to diseases and conditions of the GI tract such as cancer, gastric ulcer, gastritis, Crohn's disease, ulcerative colitis, pancreatitis and Barret's oesophagus. The CS 198 polypeptides are useful as standards or reagents in diagnostic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            immunoassays, as components or as target sites for various therapies. Antibodies directed against at least one epitope contained within these polypeptides are useful as delivery agents for therapeutic agents, in diagnostic tests and for screening for conditions or diseases associated with CS 198, particularly cancer. Monoclonal antibodies may also be used for the generation of chimeric antibodies for therapeutic use. The CS 198 polynucleotide is also useful in gene therapy and drug screening. The method of the invention provides an alternative, non-surgical diagnostic method capable of detecting early stage GI tract disease such as cancer. The present sequence is human CS 198 polypeptide

The invention relates to polynucleotides (AAKS1456-AAKS3435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or

Detecting the presence of a target CS198 polynucleotide in a test sample comprises contacting the sample with a CS198 specific polynucleotide and detecting the presence of the target CS198 polynucleotide in the test

The invention describes a method of detecting

the

presence

of a target

The method comprises contacting the test sample with at least one CS198 specific polynucleotide or its complement, and detecting the presence of the target CS198 polynucleotide in the test sample, where the CS198-specific polynucleotide has at least 50% identity to a polynucleotide having any of the 27 fully defined sequences of 34-2894 bp (S1-27) given in the specification, or their fragments or complements. The composition and methods are useful in diagnosing, staging, monitoring, prognosticating, preventing or treating, or determining the predisposition of an individual to, diseases and conditions of the gastrointestinal tract, e.g. cancer and in gene therapy. This is the predicted amino acid sequence of the human CS198 protein derived from the CS198 consensus sequence shown in seq id 27.
The present invention relates to human NC1, NC2 and NC3 proteins and coding sequences (ADG14340-ADG14345). The coding sequences are useful for detecting and screening proliferative insulin-producing cells as well as differentiation and proliferation of such cells and their precursors as analogous cells in treatment of e.g. PHHI and diseases due to differentiation/proliferation abnormality, diseases of the nervous system and pancreas. The coding sequences are also useful as spontaneous proliferation models of pancreas beta-cells. The novel genes NC1, NC2 and NC3 were isolated from the pancreas of PHHI patients, which were used in testing for the detection of proliferative insulin-producing cells or pancreas beta-cells by Northern analysis.
                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; SEQ ID NO 2; 34pp; Japanese
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    patient-expressed genes for detecting and scr
insulin-producing cells in treatment of PHHI.

                                                                The invention relates to reagents and methods for detecting diseases of the gastrointestinal (GI) tract. The method involves detecting the presence of target CS198 polymucleotide in the test sample. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the CS198 polympetide, such as cancer of the gastrointestinal tract. These are also useful in gene therapy. The present sequence is a CS198 protein used to illustrate the method of the

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score

DNA Res. 11:179-197(2004).

I FUNCTION: Participates actively in the response to hyperosmotic and heat shock by preventing the aggregation of stress-denatured proteins, in association with dnak and grpE. It is the nucleotide exchange factor for dnak and may function as a thermosensor. Unfolded proteins bind initially to dnay, upon interaction with the dnay-bound protein, dnak hydrolyzes its bound ATP, resulting in the formation of a stable complex. GrpE releases ADP from dnak, ATP binding to dnak triggers the release of the substrate protein, thus completing the reaction cycle. Several rounds of ATP-dependent interactions between dnay, dnak and grpE are required for fully efficient folding (By similarity).

1. SUBURIT: Homodimer (By similarity).

1. SUBURIT: SUBURIT: Belongs to the grpE family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDINE-21470413; PubMed-11586360; DOI-10.1038/35097083;

                                                                                                                                                                                                                        CC -i-FUNCTION: Participates actively in the response to hyperosmotic CC and heat shock by preventing the aggregation of stress-denatured CC proteins, in association with dnak and grpE. It is the nucleotide CC exchange factor for dnak and may function as a thermosensor. Unfolded proteins bind initially to dnaJ; upon interaction with CC the dnaJ-bound protein, dnak hydrolyzes its bound ATP, resulting CC in the formation of a stable complex. GrpE releases ADP from dnak; CC ATP binding to dnak triggers the release of the substrate protein, CC thus completing the reaction cycle. Several rounds of ATP-CC dependent interactions between dnaJ, dnak and grpE are required CC for fully efficient folding (By similarity).
